
Polynomial edge correction and 16 ns echo smoothing
a Full 30 µs envelope — logarithmic above 10⁻⁸
Unsigned envelope g(t)
Time from midpoint (µs)
Hard cutoff
Polynomial p = 5 + cutoff subtraction
C² subtraction
b Turn-on edge
Hard cutoff jumps by c = 0.001
c Turn-off edge
Both corrections reach zero smoothly
d Signed I envelope near the midpoint
I(t) / A
Time from midpoint (ns)
Abrupt echo reference
The three smoothed curves nearly overlap here.
e Common echo sign factor
s(t)
16 ns
16 ns sine transition
Abrupt sign flip
